

## A Case of the 10 days

### Case 347

A fifty-year-old male presented in our hospital for fever and swollen bilateral hand, especially left painful hand which had been consistent since yesterday. His hand was becoming numbness and turning color blue. His blood pressure revealed 80 mmHg. Present illness revealed body temperature 40°C, pulse rate 120/min, and SpO2 94 %. His left digit was swollen with cyanosis (Fig. 1). He was previously treated for ulcerative colitis.

Fig. 1 Left hand was swollen and the tip of the third digit was cyanotic. Small red spots were found at digit and palmer.

What is clinical diagnosis?

1. **Burger disease**
2. **Septic emboli**
3. **Takayasu disease**
4. **Kawasaki disease**
